

SURESTART Preventive Maintenance Service

Engines and Generators PM Level 10

Megohmmeter Testing

This test measures the integrity of your generator's insulation.

- Electrical windings in generators are covered with epoxy insulation. Vibration, general usage, or moisture can break the epoxy down and cause electrical shorts.
- A Megohmmeter Test will identify any decrease in your generator's epoxy capacity, saving you from a major repair bill or replacement of the generator.
- *Recommended every six months for prime and continuous applications, every 12 months for load management or standby applications.*

SURESTART Service is a Quinn preventive maintenance and inspection program, custom designed to help reduce power system operating costs, prolong component life, and increase the overall reliability of your equipment.
